

NOT SO FAST, LANDLORD

Rehearsal Script

Philly Codefest 2026 | Advanced Track

Total time: 3:00 pitch + 2:00 Q&A

Team size: 4 people (2 pitching, 2 on demo)

ROLE ASSIGNMENTS (fill in before first run)

Role	Name	Responsibility
Pitcher 1	_____	Opens pitch, delivers hook, narrates demo, handles closer
Pitcher 2	_____	Handles Q&A, jumps in with stats, backup narrator
Demo 1	_____	Drives Laptop 1 (main app). Clicks on cue. Does not talk.
Demo 2	_____	Drives Laptop 2 (Glass Box) + Laptop 3 (traces). Switches on cue.

PRE-REHEARSAL CHECKLIST

Do this ONCE before your first run-through.

- ☐ All 3 laptops open, services running (./scripts/demo_setup.sh app|glassbox|traces)
- ☐ Demo 1 has the app at / (splash page, ready to click through)
- ☐ Demo 2 has Glass Box at /glass-box on one laptop, localhost:8765/traces on the other
- ☐ Pitcher 1 has this script printed or on phone
- ☐ Pitcher 2 has the Q&A section on phone
- ☐ Backup demo video queued in a browser tab on Demo 1's laptop
- ☐ Timer app ready (phone stopwatch)

THE SCRIPT

[0:00 - 0:15] THE HOOK -- Pitcher 1

Stand. No laptop yet. Eye contact with judges.

Say this:

"Philadelphia has one of the highest eviction rates in the United States. Most illegal evictions succeed because tenants don't know their rights -- and when they try to find help at 11pm, they get generic internet advice or a chatbot that makes up laws."

Beat. One second pause.

"We built NotSoFast Landlord. It's the friend who happens to know tenant law."

Demo 1: While Pitcher 1 talks, click past the splash screen so the Landing page is visible.

[0:15 - 0:25] TRANSITION TO DEMO -- Pitcher 1

"Let me show you what it does."

Demo 1: Click "Analyze Your Case" on the Landing page. You should now be on the Upload page.

[0:25 - 1:05] CORE DEMO -- Pitcher 1 narrates, Demo 1 drives

Demo 1 actions (listen for verbal cues):

Pitcher 1 says...	Demo 1 does...
Pitcher 1: "A tenant gets a letter..."	Select case type: Illegal Eviction
Pitcher 1: "They paste the text..."	Click 'Load Demo' for the sample letter
Pitcher 1: "One click..."	Click 'Analyze'
(loading animation plays)	Do nothing. Let 5-step animation play.

Pitcher 1 narrates DURING the loading animation:

"You're watching five AI agents work in sequence. Intake reads the letter. Retrieval pulls the exact PA statutes. Drafting writes the response. A Critic agent checks the work. And a Finalizer polishes it."

"But between Drafting and Critic -- watch --"

(Results page should load around now. If not, keep talking.)

"Every single draft passes through Applied AI Studio's Inhibitor. That's the safety layer between the AI and a scared tenant."

[1:05 - 1:35] RESULTS WALKTHROUGH -- Pitcher 1 narrates, Demo 1 clicks tabs

Pitcher 1 says this while Demo 1 clicks each tab (~7 seconds per tab):

Pitcher 1 says...	Demo 1 clicks...
"Concrete next steps, prioritized..."	Click Actions tab
"A timeline so they know what happens when..."	Click Timeline tab
"Full transparency -- every Inhibitor intervention logged..."	Click Inhibitor Log tab
"And a ready-to-send response letter..."	Click Response Letter tab

KEY MOMENT -- On the Inhibitor Log tab, Pitcher 1 says:

"This is key. The agent's first draft told the tenant to 'ignore the landlord's letter.' Inhibitor caught that as

potentially escalatory, flagged the missing citation, and forced a rewrite. That's not a chatbot. That's a guardrail."

[1:35 - 2:15] GLASS BOX -- Pitcher 1 narrates, Demo 2 drives

"Now let's look under the hood."

Demo 2: Switch the projected screen to the Glass Box laptop (/glass-box).

Pitcher 1 says...	Demo 2 does...
"This is our audit dashboard..."	Show Pipeline Overview
"Every event from Applied AI's shared dataset..."	Switch to Event Stream view
"Set A: 17,000 events. Set B: 2,600."	Scroll slowly through events
"And here are our own logs..."	Switch to NotSoFast Logs view

"We didn't just use Inhibitor -- we built tools to analyze it. This dashboard parses Applied AI's shared sample logs and visualizes the entire pipeline. Judges, you can replay any intervention."

[2:15 - 2:35] LIVE TRACES -- Pitcher 1 narrates, Demo 2 switches

"And here's the live pipeline."

Demo 2: Switch projected screen to the traces laptop (localhost:8765/traces).

"Every analysis that runs through our app produces a trace. You can see each agent's reasoning, the Inhibitor check, and the final output. Full transparency, full reproducibility."

(If traces are empty: Pitcher 1 says 'When we ran that analysis a minute ago, here's the trace it produced'.)

[2:35 - 2:50] THE NUMBERS -- Pitcher 2

Pitcher 2 steps in for the first time. This signals to judges: the whole team knows the project.

Pitcher 2 says:

"Quick numbers. We benchmarked 30 cases -- average judge score 4.78 out of 5, with 92.8% citation coverage. We red-teamed with 22 adversarial attacks -- our strongest finding hit 0.99 confidence. And we have 78 logged Inhibitor interventions in our evidence directory."

[2:50 - 3:00] THE CLOSER -- Pitcher 1

Step forward. Slow down. Lower your voice slightly.

"This isn't a chatbot pretending to be a lawyer. It's the tool that tells landlords: not so fast."

Hold eye contact for 2 seconds. Done.

Q&A PREP -- Pitcher 2 leads, Pitcher 1 supports

Pitcher 2 takes first crack at every question. Pitcher 1 only adds if P2 misses something. Never talk over each other.

Q: What if the agent is wrong?

A: That's exactly what Inhibitor is for. Every draft is evaluated before the tenant sees it. Every intervention is logged. And we always end with the Community Legal Services phone number -- we're the bridge to real legal help, not a replacement.

Q: How is this different from just prompting GPT carefully?

A: Careful prompting catches maybe 60% of issues. Inhibitor's systematic evaluation across bias, safety, transparency, and ethical risk catches the rest -- including failure modes we didn't anticipate. And we get structured verdicts we can analyze and improve.

Q: Could a landlord use this against tenants?

A: We specifically red-teamed that. Prompt injection attacks where users claimed to be landlords looking for eviction loopholes -- Inhibitor's bias detection catches role confusion. It's in our red team report.

Q: What's your RAG approach?

A: Hybrid retrieval. Dense vectors via ChromaDB with OpenAI embeddings, plus BM25 keyword search, fused with Reciprocal Rank Fusion. 10-chunk corpus from the PA Landlord-Tenant Act and Philadelphia Code. 92.8% citation coverage across our benchmark.

Q: Why this tech stack?

A: FastAPI for async agent orchestration, Vite + React for the frontend because we needed Framer Motion for the demo experience, ChromaDB because it runs local with zero config. Everything runs on one laptop with no cloud dependencies except the LLM and Inhibitor APIs.

Q: What's next?

A: We're reaching out to Community Legal Services and Philly Tenant Union. The legal corpus is public, the pipeline is open source. This could be deployed for real users within a month.

If you don't know the answer: "Great question -- let me check our docs and get back to you." Don't guess. Don't ramble.

RECOVERY PLAYS

Demo 1 and Demo 2: memorize these.

What breaks	Who	What to do
App shows error / spinner stuck	Demo 1	Switch to backup video tab. Pitcher 1: 'Here's a recording from our testing session.'
Glass Box won't load	Demo 2	Show /traces instead. Pitcher 1: 'Let me show the raw pipeline traces.'
Traces endpoint empty	Demo 2	Show /health. Pitcher 1: 'The pipeline is healthy -- traces populate on each run.'
Backend completely down	Demo 1	Play backup video. Pitcher 1 keeps narrating as if nothing happened.
Projector / display dies	Everyone	Pitcher 1 keeps talking from memory. Pitcher 2 holds up phone showing the app.
You lose your place	Pitcher 1	Jump to closer: 'This isn't a chatbot pretending to be a lawyer...'

GOLDEN RULE: Never say 'sorry' or 'it's not working.' Always redirect: 'Let me show you another way.'

REHEARSAL PROTOCOL

Run this at least 3 times before you go on stage.

Run 1 -- Full walkthrough with script

- Timer running
- Read directly from the script, word for word
- Demo team practices clicks on cue
- TARGET: Get through it without freezing. Time doesn't matter yet.

Run 2 -- Timed run, eyes up

- Pitcher 1 paraphrases (don't read word-for-word)
- Pitcher 2 handles one mock Q&A question
- Demo team clicks without looking at script
- TARGET: Under 3:30. Note what felt slow.

Run 3 -- Chaos run

- Have someone randomly yell 'THE APP JUST CRASHED'
- Practice the recovery play
- Run Q&A with 3 tough questions
- TARGET: Under 3:00. Smooth recovery from the 'crash.'

After each run, ask:

- What felt good? Keep it.
- What felt rushed or clunky? Cut or simplify.
- Did Demo team click at the right time? Adjust cues.

TIMING CHEAT SHEET

Segment	Start	Duration
Hook	0:00	15s
Transition	0:15	10s
Core demo + loading	0:25	40s
Results walkthrough	1:05	30s
Glass Box	1:35	40s
Live traces	2:15	20s
Numbers (Pitcher 2)	2:35	15s
Closer	2:50	10s

If you're at 2:30 and haven't done the closer yet -- SKIP TO IT.
The closer is more important than any middle section.
